## CONVERGENCE

POTENTIAL SOLUTIONS	PROs	CONs					
ADD DELIVERY POINTS "at par value"  Mid-South River Stations  Ohio River Stations  Ohio Rail Facilities	Likely improves local basis levels Reduces basis volatility in the region	Does not resolve the problem with convergence The market is not suffering from a lack of deliveries Would represent a disadvantage for the stopper					
ADD DELIVERY POINTS "safety value"  At a discount to the primary  Delivery Point	Same as above	Same as above, but no disadvantage to the stopper					
CHANGE STORAGE RATES  Modest Increase in all Storage Rates	Better reflects current value of storage	Does not resolve the problem with convergence					
Large Increase in all Storage Rates (e.g.,doubling of storage rates)	Allows more volatility in spreads and less in basis Enhances convergence in surplus years	Makes the market less responsive to bullish fundamentals Creates potential for an opposite imbalance in tight stock years Creates incentive for "production" for CME rather than consumer Increases burden on long hedgers					
Implement Seasonal Storage Rates	Better reflects value of storage during peak periods	Does not resolve the problem with convergence					

POTENTIAL SOLUTIONS	PROs	CONs				
COMPELLED LOAD-OUT						
No Qualifications or Limits	Would force convergence in cash/futures	Creates an unmanageable risk for the long-hedger				
		Creates an imbalance in favor of the short-hedger				
		Could dramatically reduce liquidity as long-hedgers see other alternative				
		Could force current "on-exchange" volume to OTC				
With Limits to Maintain Market Balance	Would force convergence in cash/futures	Represents a material change that could destablize the market				
	Restores confidence/dependable of short-hedges	All of the comments in compelled loadout section apply				
		unless structure & limits are designed properly to assure market				
		balance				
CASH SETTLED INDEX	Potential solution to convergence	Represents a radical change with unknown consequenses				
		Creates new basis exposure for elevator operators				
		Elimates delivery system as the ultimate market and source for physical				
		Could create advantage for large networks over smaller operators				
		No guarantee that it will create convergence				
SERIAL FUTURES CONTRACTS	Creates enhanced hedging opportunities	Not a solution for convergence				
(e.g.monthly ctr)	Reduces time-frame/risk of market imbalances
